### **IMOLA Knowledge Organization System Information**

IMOLA Knowledge Organization System -I.KOS- is a repository defining the placeholders/terms that compose the structure of the European Land Registry Document template -ELRD-, in order to present in a common framework the Land Registry information from the diffrent MSs, enabling a better understanding of its content, the so called national concepts, and the creation of semantic relationships among those specific national concepts and their attributes. The structure of the I.KOS consists of a list of terms called "pivots" related in a hierarchical manner. These "pivots" are the central focus because these terms replicate the ELRD structure as well.

I.KOS describes the data managed by the system (metadata), using these concepts or keywords as starting point for achieving a semantic shared knowledge repository and ELRD enrichment with the metadata, grounded in a Corpus Semantic that settle the Land Registry common semantic model, (LR context specific domain), aligned with the ISA core vocabularies within the European Interoperability Framework -EIF-.

#### **IMOLA** Disclaimer

The following legal information has been produced by the national land registers of Europe for the IMOLA's research Project. It provides practical guidance for a better understanding of the legal information related to immovable properties issued by each Member State and presented in a common template, the European Land Registry Document, (ELRD), by giving a basic explanation of the rights, restrictions and other legal situations published by the Land Register. We encourage the user not to take decisions based on this solely information document and strongly recommend to check for further legal advise.

IMOLA I

### Background

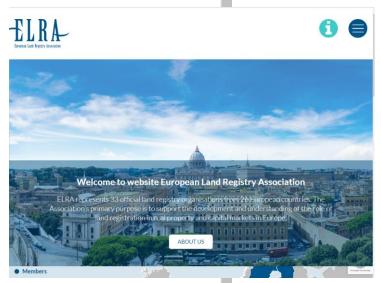

**ELRA** 

There is a need for a standard means of accessing basic land registry information within the EU. Yet, the cross-border exchange of information between European land registries is complicated. Differences in national legislation and divergences inherent to the practice of land registration are the main causes of this complexity. Therefore, a need for a standard means of accessing basic land registry information within the EU, paired with the availability of explanatory material and the training of practitioners to improve the understanding of foreign legal systems, is evident.

Common points do exist and offer the possibility of defining a structure of key information shared by the majority of land registry systems. The IMOLA project subsididised by the EC Civil Justice

### Encumbrances

As the matter of Part C, encumbrances generally are burdens, constraints or impediments falling on the properties or LR Units. Encumbrances can mean restrictions on the use, on the proprietor's powers of transfer, on the possession, or involve liabilities to which the properties are subject. They can be property rights or rights in rem, mortgages, judicial or administrative restrictions and any other type of constraints or limitations related to the properties. Strictly speaking encumbrances can be considered a synonym of burdens.
